

5. MASTER.md

AGEX 전체 개발의 최상위 SSOT

MASTER.md는 너무 길면 안 된다.

30종 내용을 다시 복사하는 파일이 아니라 **최상위 헌법 + 문서 라우터** 역할을 해야 한다.

권장 최종본:

AGEX Master Specification

Implementation authority:

1. MASTER.md
2. Canonical machine-readable schemas/contracts
3. Core architecture specifications
4. Domain specifications
5. API specification
6. Development/WBS documents
7. Guides
8. Existing code

18. Coding sequence

For public platform functionality:

Requirement

- Specification
- Canonical Schema
- API/Event Contract
- Implementation
- Tests
- Documentation
- Acceptance

Do not reverse this order.

19. Definition of Done

Where applicable:

- contract complete
- code complete
- unit test
- contract test
- integration test
- tenant isolation test
- security test
- observability

- documentation
- acceptance evidence

AI features additionally require evaluation.

20. Architecture evolution

Initial implementation preference:

Modular Monolith

+

Distributed Runtime Workers

Do not split into microservices unless justified by:

- independent scale
- security boundary
- failure isolation
- deployment lifecycle
- team ownership
- specialized infrastructure

21. MVP boundary

Core MVP includes:

- Tenant
- IAM
- Core Resource
- Runtime
- Agent L0-L2
- Workflow
- Model Gateway
- Basic Knowledge
- Basic Memory
- Plugin Core
- Security
- Audit
- Usage
- Observability
- API/SDK
- Minimal Developer Console

Not required for first Core MVP:

- public marketplace

- full billing
- L4/L5
- complex multi-agent
- federation
- self-improvement
- advanced dynamic workflow generation

22. Governing documentation

Use `/docs/INDEX.md` to find the authoritative document for each domain.

Never treat a guide or UI implementation as the primary source when an architecture/domain specification exists.
